门禁报警事件模块 Page 1 of 7

报警事件

明眸门禁产品包括门禁主机、人员通道、明眸人证、梯控主机等,事件包含刷卡、刷脸、指纹、二维码认证结果和身份证刷卡事件以及测温信息等。

获取事件信息的方法有两种: 1) 报警布防,获取设备实时上传的事件信息; 2) 事件查询,事后查询设备本地存储的历史事件。

目录

- 报警事件
 - 0 <u>目录</u>
 - o <u>一、报警布防</u>
 - 1.1 接口调用流程
 - 1.2 示例代码
 - o <u>二、事件查询</u>
 - 2.1 接口调用流程
 - 2.2 示例代码

一、报警布防

1.1 接口调用流程

- 初始化NET_DVR_Init接口在程序开始是调用,一个程序只需要调用一次。
- 用户注册即登录门口机,调用NET DVR Login V40接口,每一台设备只需要登录一次。
- 报警布防方式实现方法
- 1) 先调用NET_DVR_SetDVRMessageCallBack_V50设置报警回调函数(V31接口也支持,不能使用V30接口),在SDK初始化之后即可以调用,多台设备对接时也只需要调用一次设置一个回调函数,回调函数里面接收数据之后可以通过报警设备信息(NET_DVR_ALARMER)中IUserID等参数判断区分设备。
- 2) 每台设备分别登录,分别调用<u>NET DVR SetupAlarmChan V41</u>进行布防,布防即建立设备跟客户端之间报警上传的连接通道,这样设备发生报警之后通过该连接上传报警信息,SDK在报警回调函数中接收和处理报警信息数据即可。
- 3) 程序退出前或者不需要接收报警信息时调用<u>NET_DVR_CloseAlarmChan_V30</u>进行撤防,释放资源,此时连接断开,设备将不再上传报警信息。
- 刷卡、刷脸、指纹等认证方式对应门禁主机报警信息,回调函数中获取的报警类型(ICommand)为COMM_ALARM_ACS, 报警信息(pAlarmInfo)对应结构体: NET DVR ACS ALARM INFO, 其中 pAcsEventInfoExtendV20指向一个NET DVR ACS EVENT INFO EXTEND V20结构体, 里面包含测温温度信息,身份证刷卡事件对应门禁身份证刷卡信息,回调函数中获取的报警类型 (ICommand)为COMM_ID_INFO_ALARM, 接警信息(pAlarmInfo)对应结构体: NET DVR ID CARD INFO ALARM, 其中pIDCardInfoExtend指向一个NET DVR ID CARD INFO EXTEND结构体, 里面包含测温温度信息, 报警信息结构体中域Major, dwMinor表示报警主类型和次类型。通过这两个参数值来判断实际的事件,比如是刷脸还是刷卡。成功还是失败、对应不同的事件次类型。
- 退出程序时调用NET DVR Logout注销设备,每一台设备调用一次。最后调用NET DVR Cleanup释放SDK所有资源。

1.2 示例代码

```
#include <stdio.h>
#include <iostream>
#include 'Windows.h*
#include "Windows.h*
#include "HCNetSDK.h*
using namespace std;

  printf("input: ");
  scanf("%c", &c);
//退出程序
//撤销布防上传通道
if (!NET_DVR_CloseAlarmChan_V30(lHandle))
  printf("NET_DVR_CloseAlarmChan_V30 failed, error code: %d\n", NET_DVR_GetLastError());
  NET_DVR_Logout(IUserID);
  NET_DVR_Cleanup();
  return;
//注销用户
NET_DVR_Logout(IUserID);
//释放SDK资源
NET_DVR_Cleanup();
return;
```

二、事件查询

2.1 接口调用流程

门禁报警事件模块 Page 5 of 7

- 初始化NET DVR Init接口在程序开始是调用,一个程序只需要调用一次。
- 用户注册即登录门口机,调用<u>NET DVR Login V40</u>接口,每一台设备只需要登录一次。
- 查询事件是指查找设备本地存储的历史事件,先调用NET_DVR_StartRemoteConfig(命令: NET_DVR_GET_ACS_EVENT)建立长连接,指定查找条件(NET_DVR_ACS_EVENT_COND),然后循环调用 NET_DVR_GetNextRemoteConfig逐条获取查找的结果信息(NET_DVR_ACS_EVENT_CFG),查询结束之后调用NET_DVR_StopRemoteConfig关闭长连接,释放资源。
- 退出程序时调用NET DVR Logout注销设备,每一台设备调用一次。最后调用NET DVR Cleanup释放SDK所有资源。

2.2 示例代码

```
#include "stdafx.h"
#include "include\HCNetSDK.h"
#include <stdio.h>
#include <iostream>
#include <stdlih h>
#include <string>
using namespace std;
int DoLogin();
void GetEventInfo(int ILoginID);
int _tmain(int argc, _TCHAR* argv[])
  //初始化
  NET_DVR_Init();
  //登录设备
  int IUserID = DoLogin();
  if (IUserID < 0)
   return 0;
  }
  //查询事件信息
  GetEventInfo(IUserID):
  Sleep(500);
  //注销登录
  NET\_DVR\_Logout(IUserID);
  //反初始化,释放资源
  NET_DVR_Cleanup();
  return 1;
//设备登录
int DoLogin()
 //注册参数
  NET_DVR_USER_LOGIN_INFO struLoginInfo = { 0 };
  struLoginInfo.bUseAsynLogin = 0; //同步登录方式
  strcpy(struLoginInfo.sDeviceAddress, "10.17.36.2"); //设备IP地址
  struLoginInfo.wPort = 8000; //设备服务端口
  strcpv(struLoginInfo.sUserName, "admin"); //设备登录用户名
```

```
strcpy(struLoginInfo.sPassword, "abcd1234"); //设备登录密码
  //设备参数结构体
  NET DVR DEVICEINFO V40 struDeviceInfoV40:
  memset(&struDeviceInfoV40, 0, sizeof(NET DVR DEVICEINFO V40));
  //设备注册
  int\ ILoginID = NET\_DVR\_Login\_V40 (\&struLoginInfo, \&struDeviceInfoV40); \\
